

# For wireless, handheld functionality

TraxsMobile-Warehouse is a wireless application for handheld units and is integrated with ART's TraxsMobile-Server product. Once the software has been installed, no physical connection to a PC is required. This handheld functionality within a wireless environment makes it ideal for use within a warehouse or large store, enabling functions such as picking or transfer between locations to take place in real-time.

## >> Core functions

A wide range of core functions is provided by the system, including: **user logon**, for additional security and providing details of the user's task and location; **stocktaking**, which can be planned from the back office and initiated from the handheld device; and **order picking**, enabling stock to be pre-allocated via a link with the Traxs automated branch replenishment system, and directing users to the correct locations by planned routes.

Users can also **book in PO receipts** by purchase order, supplier or product, via a direct link with the Traxs automated purchasing system; and **implement stock movements**, including site-to-site transfers, stock put-away, location to location, write-offs, returns, and transfer to and from external locations. Up-to-the-minute data collection also facilitates adhoc stock counts and movements, and label printing, if required.

## >> Easy to use

TraxsMobile Warehouse runs on Windows CE and is written in Microsoft .NET, ensuring a familiar environment is displayed on each handheld device. Along with the application's intuitive design, this immediate familiarity aids user confidence and reduces training time. Administrative users can use the TraxsMobile-Server to change the functionality of the handheld unit by following web-based, simple-to-use, step-by-step instructions.

## >> Flexible

The standard version is targeted at Datalogic and Motorola devices, although its flexible design means that the software is compatible with devices from other manufacturers, as required. Designed to integrate easily within the entire Traxs product range, the TraxsMobile suite of products can also be used with other software packages and to assist with this, an API for integration purposes is available on request.

ART can provide a full installation service for TraxsMobile products and, in particular, is experienced in setting up wireless networks within difficult environments, where there are multiple floor levels and/or steel racking systems.
